

Binary Prophecy and the Binary Prophet

Thursday, August 6, 2020

A functional mind is the most powerful life support system possible; its job, by biological fact and by Biblical metaphor, is prophecy, or what may be called judgment which is accomplished through four, and only four, specific grammar systems each of which manipulates binary or again, produce binary recursion, peculiar to it. In short, our mind accomplishes its biologically defined job by the recursion of memory through binary memory manipulation using four specific systems of grammar; Common Grammar, Arithmetic, Algebra and Geometry. These are each a method of binary recursion formed by pairing the two elements of a grammar system, its symbol set and its method of producing memory addressing which can be called indexes or names, paired to the intelligible and universal binary which can be comprehended as the definition of any thing whatsoever. The two elements of a thing in the intelligible binary multiplied by the two elements of that thing called grammar produced by a species' intelligent behavior, produces exactly four results. Two squared equals four.

As it is currently a known fact that a computer can process all information, every system of grammar and be used to guide the behaviors of any machine, I will start exploring the idea of binary recursion through the prophetic development in the Bible; this may seem odd especially to those whose mind cannot seem to manage metaphor, or what is also called geometric, proportional and even algebraic reasoning.

The entire set of *Dialogs* produced by Plato was aimed at binary information processing which he called *Dialectic*, speaking by two's together. Simple minded scholars take this to mean two people; while Plato repeatedly states that it is how names, in every possible system of grammar are used by a mind. Stupid scholars thus refer to a perceptible,

while Plato, a genius among mortals, was denoting a factual intelligible unavailable to these scholars. Stupid scholars imagine that there are different kinds of dialectic, Plato's Dialectic, Kantian Dialectic, banana peel dialectic, etc.. Plato is not the creator of binary information processing, in case the idea escapes you; as he stated more than once, he was denoting biological fact.

As a thing is defined as a relative constrained by correlatives, arithmetic information processing is based on the noun, or the correlatives, while geometric information processing is based on the verb, or the relative difference. The ability to process information hinges on being able to do both in relation to information management. As a noun has the potential to have an infinite variety of names to denote any particular thing, the verb is determined by physical fact and thus biology; a form of life can only process a certain number of relative differences, the universe, itself, is composed of a certain number of relative differences; this means that every thing is grouped under the name not of particular examples, but under the name of the class which is composed of a particular relative difference. Thus, these two types of information processing involve a simple inversion; this inversion, however, denotes a quantum leap in intelligence and psychology. Plato called this the ability to see the similar idea in the many examples, or a class name denoting a verb which contains any number of particular individuals, named in accordance with a noun, because one can see, as an intelligible, the same relative difference by which the class was constructed. In short, metaphor and class mechanics are synonyms. Plato's concern was the general notion of the good as related to the life support systems of the human body.

The computer examples this metaphorical fact, it accomplishes the whole of binary recursion using the relative difference of electricity, however, the history of computers have used a variety of other materials,

from smoke to water, wood and stone, paper to a computer screen. The computer also uses a perceptible relative difference, while metaphor can use either the perceptible or the intelligible relative difference. In short, the computer is not as capable, and never will be, as a human mind for an inanimate object will never know the relative difference of a life form.

Prophecy by which is taken advantage of by binary recursion is based on the simple fact of universal constants, the relative differences which compose the universe, while arithmetic thinkers are chained to the particular examples of a thing, wholly ignorant of these universal relative differences. For example, even in science today, universal constants are simply numbers used in equations, like any idiot would imagine that meaning. Thus a mind evolves from simple minded arithmetic information processing until it fully comprehends geometric information processing, or again, metaphor. It is in this wise, as is written in the Bible, that mankind would be illiterate, unable to read the Bible, until after it has been introduced to a pure language on a global basis. That pure language is actually introduced in *Genesis*, as Adam and Eve, among other metaphors. Adam and Eve are a Conjugate Binary Pair, which, by complete induction and deduction, produces the human race. Now if you are really stupid, you go looking for them in the dirt and in bones, however, if you are intelligent you look for them in your own biology. Those capable of comprehending metaphor can see this as the very same definition by which a computer processes all information and regulates the behavior of any machine and even beyond that, this is the same definition of the four systems of grammar, the grammar matrix, by which a functional mind uses to do its job; i.e., this metaphor is taking advantage of the distinction of two types of life, or what it means to be born again, the distinction between the perceptible, which is common to all forms of life, to the intelligible, which is only the product of a functional mind. The mastery of the intelligible binary is only

accomplished by sapient life forms, of which mankind is not yet a member.

It is this use of metaphor, to produce a book which has been and still is above the intelligence level of mankind which indicates that the Bible is an artifact which satisfies what is called, *First Contact Protocol*, the introduction of linguistic code. The introduction of linguistic code given in the Bible is one that complies with biological fact, a mind, through binary recursion, manages every behavior of a life form. Thus, when one can see it, the Bible becomes an introduction to when, we, as a species, will be allowed to join other sapient life forms in the universe. Currently, the human race does not even have a correct grammar book, even though, the idea of binary recursion has been introduced through the *Bible*, the *Dialogs* of Plato, the *Elements* of Euclid, the computer, and even our own biology. Mankind is still too dim witted to read and write, by biological fact and has never compiled a correct grammar book, nor recognized Nomocracy.

As mankind has yet to comprehend the universality of binary recursion, it certainly is unaware of the two distinct types of reasoning produced by binary, arithmetic and geometric. Mankind may be aware of these two names, but has yet to comprehend how they display the evolutionary development of a mind until the day that mind can do its biologically defined job which demands standards of mental and human behavior based on simple unity. In terms of a brain dead mystic, until mankind realizes, as a fact of mental processing, being one with the universe instead of one distinct from the universe known also as schizophrenia. As Plato noted, no madman is a friend of God, and echoed by our alien neighbors, no insane species is sapient.

A non-sapient species, when becoming linguistically functional, enumerates countless laws, laws virtually numbering in the millions. While a sapient species knows that Law is established, by fact, by its

grammar systems. A functional grammar, as a means of effecting binary recursion, always producing a binary result, is called Nomocracy. What this means is that sapient behavior, throughout the Universe, is based on standards of behavior derived from simple binary recursion which is used to formulate every possible judgment, at any possible time, during the whole of sapient discourse. If one cannot manage two simple concepts, how can it call itself self-aware? How can an intelligent form of life claim that two concepts are beyond its scope of management? These are simply not possible as any admission would denote a self-referential fallacy known as schizophrenia.

In the metaphors of the Bible, a grammatical product well beyond the mental ability of mankind, the Two Witnesses of God, are only known, when a mind becomes functional through the recognition of the intelligible binary which produces the only power the functional life support system of a mind can possibly recognize. This is a simple biological fact which has nothing whatsoever to do with religion or mysticism, or the ignorant gibberish of the majority of mankind. By biological and physical fact, a form of life can only name the two elements of any thing. By biological fact, the correlatives can take on an infinite variety of names while the relative differences, provided by the environment of a life form, might be called, simple chemistry. One has to be really stupid to imagine that any particular individual can learn millions of laws, be responsible for effecting behavior through millions of laws, and yet not even be able to write a simple grammar book upon which these laws, by grammatical fact, have to be derived from. Just ask any linguist today, is Language an intelligible, a biological and physical fact, while grammar is particular and perceptible? Their own literature is wholly innocent of such a distinction which is a tacit admission of that very same lack of intelligence. The very laws, or factual gibberish of lawmakers today, deny the very admissions of our own linguists. When

one does not know what speech is, how can one imagine that they know what freedom of speech even means? For those Platonic scholars, in Plato's own words, this is what is meant by the allegory of the cave. How in the hell can you claim any knowledge of the perceptible when you are wholly ignorant of the intelligible?

So, try it yourself. Draw a simple line and divide it as many times as you like and name each division. No matter how many times you divide it, you still have only one relative difference as opposed to the infinite number of nouns to denote each point. It is a simple fact which is ignored by every so called genius today. Geometric information processing is not based on the noun, but the verb, the actual material difference. Now, look at the two stories of creation in the Bible, one appears to be very good, the other very evil, yet look at the relative differences in each story, they are identical. Judge not by appearance...unless you are an illiterate and insane savage. Judgment is performed by the verb; in short, a species level of intelligence is a measurement of its every behavior. As Plato spoofed the etymology of linguist who go looking for meaning in words, anyone with the least bit of intelligence will tell you that meaning is established by standards of mental behavior, the pairing of the intelligible with the perceptible; so too is one told this very same fact in the Bible.

The stupid use the Bible for religion and mysticism; anyone, with a capable mind, comprehends the principles of *First Contact Protocols* of functional mental behavior as a biological fact called in metaphor, the opening of the eyes of the blind, a simple process of evolution.
